

Availability of Treatment and Rehabilitation in Federal Prison: The Critical Role of the Presentence Report

MARC BLATSTEIN, D.P.M.; FAY F. SPENCE, J.D.; E.J. HURST II, J.D.; AND MAUREEN BAIRD

Prisoners have a constitutional right to adequate medical care,¹ but what that means and how to get needed treatment are often not well understood by attorneys representing criminal defendants. This article attempts to address that knowledge deficit by explaining the medical, mental health, and substance abuse programs and policies in the federal Bureau of Prisons (BOP), as well as some of the educational, vocational, and other available programs intended to rehabilitate inmates and prepare them for return to society. Equally important, the article explains the critical role of the presentence report (PSR) in determining whether and how needed treatment and programs will be available to a defendant. Documentation is paramount, and the diligent attorney must be proactive in gathering and supplying the appropriate documentation to the probation officer preparing the PSR and to the court, along with a sentencing memorandum advocating for the defendant's desired sentencing outcome and institutional placement, supported by the sentencing factors set forth in 18 U.S.C. § 3553(a).

The PSR plays a critical role in a defendant's post-conviction life. In federal court, the sentencing judge relies on the report to determine sentencing guidelines, departures, and statutory sentencing considerations under 18 U.S.C. § 3553(a). The BOP relies on the PSR to make decisions about custodial placement, security classification, educational/vocational needs, and medical/psychological treatment needs. Even once the defendant is on supervised release after incarceration, the PSR influences the probation officer's supervision of the defendant and the requirements of supervision. In short, the PSR is now part of the defendant's permanent record and is considered the gospel truth about the defendant. It truly is "the gift that keeps on giving," so accuracy is key.

Given the PSR's permanence and omnipresence, one cannot overstate its importance or the need for accuracy. Counsel must object to inaccurate facts and omissions of important information in the report. Once the court has made final rulings on all objections, and before the PSR is sent to the BOP, counsel must ensure that

the report is updated in accordance with the court's ruling. Asking to amend the PSR later, when an inmate is already in the BOP, asks a court to change positions that it has already adopted as accurate. Even if this can be done—a big if—the amendment process can take years and many attorney hours to complete.²

Components of the Federal PSR

First and foremost, the PSR provides details about the offense for which a defendant is being sentenced, whether the defendant has accepted responsibility for his or her conduct, and how the sentencing guidelines apply. The report also contains some background information about the defendant that the court may consider in deciding what sentence to impose, including prior criminal history, educational background, work history, family background, and health. Many attorneys seem to forget, however, that sentencing is only one purpose of the PSR.

The BOP initially relies on the PSR to determine a defendant’s security classification and whether to house the inmate in a high-security U.S. penitentiary (USP), a medium or low-security federal correctional institution (FCI), or a minimum-security prison camp.

The BOP also determines whether a defendant has medical or mental health needs that affect placement. Continuity of care in the BOP, to the extent it will happen, depends on an accurate PSR. The PSR acts as a “medical referral” for the client based on his or her medical and mental healthcare history, current medications, and security requirements. The PSR needs to be as complete as possible to reduce unnecessary lapses in care.

Finally, the PSR can provide information about a defendant’s educational, vocational, and avocational interests, which can facilitate placement in a facility with appropriate programs to enhance rehabilitation and successful return to society. By knowing what programs and treatment the BOP provides, an attorney can better assist the client in making sure the PSR has appropriate documentation to improve the chances of a client’s placement in the most appropriate location.

Healthcare in the Federal BOP

A defendant has a constitutional right to adequate health care. This means that prisons must provide necessary medical attention and may not act with deliberate indifference to a prisoner’s pain and suffering.³ The BOP attempts to meet its constitutional obligation efficiently and cost-effectively by having inmates placed at different facilities based on the level of medical care needed. All BOP facilities have staff members who are trained as first responders to use the automatic external defibrillator and to perform cardiopulmonary resuscitation in emergency situations.⁴

When an inmate first enters the BOP system, the Designation and Sentence Computation Center enters the defendant’s information, including criminal history, offense and sentence, and medical documents and treatment history from the PSR into their SENTRY software to determine both security classification and medical care level designation for that inmate. Designations range from CARE LEVEL I for the healthiest inmates to CARE LEVEL IV for gravely ailing inmate-patients needing inpatient care. An institution designation is then determined, based on appropriate medical care level and security classification level. Final placement decisions for those inmates with significant health concerns/conditions are made by the Office of Medical Designation and Transportation at the BOP.

Care Levels in the BOP

Care Level I is comparable to the care provided by a general practice physician that one rarely visits for the occasional minor illness or injury. This classification level is for inmates who are less than 70 years old and healthy, with limited medical needs. They have stable mental and physical health and typically need physicians no more than once every six months. Any mental health crisis would be of short duration and would not require hospitalization. Examples of “limited” medical needs assigned to Care Level I include mild asthma, diet-controlled diabetes, and stable HIV for which medications are not needed. A community hospital is usually approximately one hour away from Care Level I institutions. See Table 1 for BOP Care Level I facilities, grouped by security classification.

Most federal prison facilities are designated **Care Level II** because this is the level of care needed by the majority of people. These

facilities provide medical care for the same types of conditions as would a fully staffed internal medicine practice. Inmates designated Care Level II may have some chronic illnesses or require regular medication, but their health is generally stable, and hospitalizations are not usually required. Inmates at this level may have a mental health diagnosis requiring routine outpatient care, but all mental health concerns are controlled with medication or talk therapy. Medical or psychological patient care visits may be available monthly to quarterly. The Care Level II facilities are within one hour of a regional hospital center, but the need for hospitalization for such an inmate would not be expected more than once every two years. See Table 2 for BOP Care Level II facilities, grouped by security classification.

Care Level III facilities are located near a major community medical facility to ensure outside necessary medical care is within close proximity to the designated institution. Care Level III inmates include those needing “companions” to help with their activities of daily living (but not needing daily nursing supervision) and those needing daily to monthly medical or psychiatric visits. Other Care Level III inmates include those suffering from cancer in remission less than one year, advanced HIV, severe mental illness in remission on medication, congestive heart failure, and end-stage liver disease. These inmates may have chronic or recurrent mental illnesses or ongoing cognitive impairments. Daily inpatient nursing care is not available, but inmates at this care level may require hospitalization periodically to stabilize their medical or mental health conditions enough to keep them from deteriorating to the point of requiring around-the-clock nursing care. See Table 3 for BOP Care Level III facilities, grouped by security classification.

Care Level IV facilities are known as Medical Centers For Federal Prisoners (MCFP) or Federal Medical Centers (FMC). They operate like small hospitals and provide varying degrees of nursing and medical care, including surgical, diagnostic, and therapeutic services. They are the only BOP facilities able to provide Care Level IV inmates with the around-the-clock nursing care needed for acute

medical or chronic mental health conditions resulting in severe physical and cognitive impairments. Physical ailments designated to this level include end-stage kidney failure (requiring dialysis), unremitting cancer, quadriplegia, stroke, debilitating neurological trauma, major surgery, or high-risk pregnancy and recent transplant recipients

(within one year). Mental health diagnoses so severe that an inmate cannot function in the general population may be designated to a mental health unit within one of the prison medical facilities. Care Level IV facilities accommodate inmates of every security level, which makes the safety of a nonviolent offender an issue to be raised. See Table 4 for more detailed information about the BOP Care Level IV facilities.

Scope of Services Covered

Federal prison healthcare is implemented through a mix of BOP employees and public health service officers. Primary responsibilities fall on the primary care provider team, which provides medical care to inmate-patients under a medical or clinical director's supervision.⁵ This is the BOP's equivalent of a staffed medical practice.

Working under staff physicians (and psychiatrists at selected facilities), mid-level practitioners include registered nurses, licensed practical nurses, licensed vocational nurses, nurse practitioners,

Table 4
Care Level IV Facilities

Facility	State	Notes
FMC Butner	NC	Adjacent Medium and Low facilities; Provides inpatient mental health, cancer treatment, and dialysis

FMC Ft. Worth	TX	New Level IV facility
FMC Lexington	KY	Male and female inmates; has adjacent camp; all medical specialties
FMC Rochester	MN	Provides inpatient mental health, treatment for complex disease; referral arrangement with Mayo Clinic
FMC Springfield	MO	High security; provides dialysis and inpatient mental health care

physician assistants, and certified nursing assistants. These staffers are in turn supported by general laboratory technicians, like X-ray technicians and phlebotomists, as well as not-yet-licensed foreign medical school graduates. EMTs also act as mid-level practitioners. Additionally, all facilities have a dentist and may have contracts with orthopedics, neurologists, optometrists, and other specialists from the local community who come to the prison for onsite medical visits. Mid-level practitioners are the inmate-patient's primary point of contact. They serve as the primary care provider for routine requests, new complaint evaluations, ongoing management of recurring conditions, and emergencies.

The BOP sorts medical treatment into five categories, which can objectively be called: Life-Threatening, Medically Necessary, Medically Necessary but Not Urgent, Medically Appropriate but Not Necessary, and Extraordinary.⁶

1. Life-Threatening Conditions

Treatment for life-threatening conditions is essential to sustain life or function of a critical bodily system and requires immediate attention. The BOP refers to these conditions as "Medically Necessary—Acute or Emergent" and includes the following conditions in this category: heart attacks, severe trauma such as head injury, hemorrhage, stroke, detached retina, sudden vision loss, and complications of pregnancy or labor.⁷

2. Medically Necessary Conditions

The BOP defines this category to include conditions that are not immediately life-threatening but which without treatment now, the inmate could not be maintained without significant risk of:

- Serious deterioration leading to premature death.
- Significant reduction in the possibility of repair later without present treatment.
- Significant pain or discomfort that impairs the inmate's participation in activities of daily living.⁸

Examples of conditions the BOP includes here are chronic conditions such as high blood pressure, high cholesterol, heart disease, and diabetes; severe mental health issues (e.g., bipolar disorder, schizophrenia); infectious disorders (e.g., HIV, tuberculosis); and cancer.⁹

3. Medically Necessary but Not Urgent

The BOP actually defines this category as "Medically Acceptable—Not Always Necessary."¹⁰ The group includes conditions for which "treatment may improve the inmate's quality of life."¹¹ Examples of treatments for conditions in this category, as listed in the BOP Policy on Patient Care, include joint replacements, reconstruction of the anterior cruciate ligament (ACL) in the knee, and treatment of noncancerous skin conditions.¹² Such treatment procedures require review and approval by the institution's Utilization Review Committee, which considers various factors, including risks and benefits of the treatment, available resources (including cost of security staffing and transportation), the inmate-patient's medical history, and how intervention (or lack thereof) will impact the inmate's activities of daily living.¹³

Should an outside specialist consult be needed for a non-emergent condition, a referral request is made to the prison's Utilization Review Committee and clinical director. Other members involved in this decision-making process include the associate warden or warden, health service administrator or assistant, the medical trip coordinator, any health care providers directly involved in the referral, and perhaps the director of nursing and the chaplain or a social worker.¹⁴ The clinical director has final say over all Utilization Review Committee decisions.¹⁵ If approved, the inmate-patient will be placed on a schedule or waitlisted until the specialist has an opening during the contract's limited monthly hours, which may be several months or years later. Notably, the clinical director is under no obligation to follow medical recommendations made by the outside physician consultant specialist. If the recommendations are not followed, the clinical director will document his/her justification in the inmate health record.¹⁶ Justification may be based on the category of care sought.

4. Medically Appropriate

Some treatments, even though recommended by a health care provider and deemed appropriate by the clinical director, still require approval by the Utilization Review Committee, which is not likely to be granted. These treatments are considered by the BOP to have "limited medical value" and include cosmetic procedures and removal of noncancerous skin lesions.¹⁷ It is worth noting that some skin lesions may be misdiagnosed, so the denial of treatment for these appropriate medical procedures is a concern for inmates with such health needs.

5. Extraordinary Treatments

The BOP considers a medical treatment extraordinary if it "affect[s] the life of another individual, such as organ transplantation."¹⁸ Thus, organ transplants and experimental/investigational treatments require approval of the Utilization Review Committee, which is not likely to be granted.

Medical Devices and Pharmaceuticals

If an incarcerated inmate needs medical devices, glasses, prosthetics, or other medical support items, these can be mailed *directly* from his or her personal physician's office or a medical business (e.g., Pearl Vi-

sion) with the attached physician orders and using form BP-AO331.¹⁹ These items cannot be mailed by family members, friends, or other nonmedical civilians. Prescription eyeglasses, medical devices (such as CPAP or BiPAP or other machines for sleep apnea), prosthetics, and similar devices should also be brought with the patient, along with doctors' prescriptions and orders. The PSR should also mention that the defendant has these devices pursuant to medical orders. If the client does not take these devices with him or her when reporting, he or she may have to wait several weeks for the BOP to obtain appropriate medical devices; the inmate's family will not be allowed to mail/send the items to the facility, as they must come directly from a medical company or health care provider.

If the inmate regularly takes prescribed medication, the BOP will usually substitute generic medications for brand-named drugs. Not only does BOP policy generally require generic medications, but BOP medical personnel, pharmacists, and consulting physicians are required to use "the least expensive generic equivalent ... when available."²⁰ Thus, instead of generic equivalents, the BOP may prescribe an alternative (but less expensive) generic medication that is for treatment of the same medical condition. Much like insurance companies, the BOP has a formulary of approved medications.²¹ The formulary includes the generic name of the medication, what conditions it may be prescribed for, acceptable dose levels, and limits on the number of days the medication can be prescribed.²² Use of any medication that is not on the formulary or use of a medication in a different manner, for treatment of a different condition than authorized by the formulary, or longer than authorized, requires pre-approval from the BOP medical director, after going through the institution's clinical director and the BOP regional medical director—an extensive and lengthy process.²³ Some nonformulary drugs are available only in limited circumstances, such as the preferred medication's failure to work for the patient, but only after the lengthy pre-approval process. Some medications, such as opiate narcotics, are only available in Care Level IV facilities for very limited circumstances; those medications and psychiatric medications must be crushed by the health care provider and administered to the patient in the provider's presence.²⁴ This is to prevent diversion of the medication by inmates for unlawful purposes. Prescribing a medication without pre-approval is considered unauthorized use of government funds, a felony offense.²⁵

In short, medications the patient-inmate receives in custody will not necessarily match the medications that the inmate received before incarceration. Even if the inmate is lucky enough to be taking the same medications as before, a variety of manufacturers will provide the same generic drug in different colors, sizes, and shapes than the inmate may have been used to. To avoid unnecessary anxiety and surprise to the client, an attorney should educate his or her client about these BOP policies. If a client is on nonformulary medication, the attorney needs to assist the client in obtaining pre-approval before arrival at the facility, which takes substantial time, in order to prevent unnecessary and potentially harmful interruption of the client's medical treatment.

If a client is self-surrendering to the BOP, he or she should bring along a three to four-week supply of his or her medication in original, properly labeled bottles. These prescriptions may ultimately be returned to the client's home, but at least they will be available if needed for continuity of care purposes, in case the institution does not have the correct medication in stock.

Programming in the Federal BOP

In the last century, American society transitioned from institutionalizing people with mental health conditions in mental health facilities (often underfunded and operating under poor conditions) to incarcerating the mentally ill in jails and prisons.²⁶ Nearly 50 percent of jail inmates and over one-third of prison inmates suffer from mental health problems.²⁷ Mental illness often underlies behavioral problems, and if an incarcerated inmate has not been properly diagnosed or given treatment for a mental illness, chances are high that the inmate will be involved in fights, assaults, self-injurious behavior, or other misconduct in prison that leads to disciplinary consequences, including restrictive housing units;²⁸ use of restrictive housing units, especially solitary confinement, exacerbates mental illness rather than helping the inmate.²⁹ Therefore, it is imperative that the defense attorney makes sure that psychiatric and psychological issues are identified and included in the defendant's presentence report, along with the appropriate treatment plan recommended by a qualified psychiatric health provider. If mental health issues are apparent, but the defendant has no documentation of diagnosis or treatment, the attorney should obtain a professional psychological evaluation before the probation officer begins preparing the PSR. Failure to do so will consign the defendant to increased risk of restrictive housing or solitary confinement. When requesting placement in a specific facility or program, defense counsel should ask the court not only to recommend the placement but to include the reasons for his recommendation, which will improve the chances of securing the placement. One additional measure to possibly increase the chance of the BOP following the recommendation of the court, is to ask the sentencing judge to order the BOP to provide in writing, the reason for not following the judicial recommendation.

Documentation of known mental health issues and treatment (including substance abuse and addiction) is essential for continuity of care. Without documentation of the diagnosis and need for specific medication in the PSR, for example, an inmate entering the BOP will have no access to medication. In that case, there will be a waiting period, sometimes several weeks, before the inmate will be seen and evaluated and prescribed a medication deemed suitable by the prison medical establishment. During the delay without any medication, the inmate's condition is likely to deteriorate. In addition, when providing the substance abuse history, it is imperative that the PSR document frequency and current substance use activity. Upon initial remand or voluntary surrender to the assigned prison, the defendant may require placement in an institution that is equipped to provide a safe detox environment. If the BOP is unaware—from documented medical records in the PSR—that some medications have been unsuccessful, the patient-inmate may be doomed to another trial period of medication already known to be ineffective for him.

Beyond access to basic mental health care and medication, documentation of known mental health and related conditions is necessary for inmates to be eligible to participate in some programs. The BOP offers a variety of programs to provide mental health support, substance abuse education and treatment, continuing education, and vocational training. Other programs help inmates adjust to prison life, develop coping skills, or heal from past trauma that may have played a contributing role in an inmate's criminal conduct. However, some of the programs have very limited capacity and are offered only at certain facilities. If a defendant's need and desire for a particular program are made clear in the PSR, his or her chances

for placement at a facility offering the program will be improved. Addressing program needs with the assigned assistant U.S. attorney before sentencing and obtaining the government's agreement to recommend the placement will also improve the defendant's chances. These programs are discussed in this section.

Programs Promoting Psychological Well-Being

1. The Mental Health Treatment Programs

The BOP has a series of residential Mental Health Treatment Programs to treat inmates diagnosed with serious mental illness and behavior disorders, particularly for inmates who do not require hospitalization but nonetheless need intensive treatment services and/or lack the ability to function in a general population setting. These programs include the Habilitation Program, the Skills Program, the Axis II Program, and Mental Health Step-Down units.³⁰

The *Habilitation Program* is for high security inmates who lack the ability to adapt to the penitentiary environment because of mental illness, but who may be able to function in a medium-security environment with proper residential treatment.³¹

The *Skills Program* is for inmates with both mental illness and cognitive/intellectual limitations that limit their ability to adapt to living in the community and in prison.³² The program is currently available at FCI Danbury (Low) and FCI Coleman (Medium). The Skills Program has evolved into a residential program that now has an emphasis on addressing the needs of offenders who are determined to be on the Autism Spectrum. This 12-18 month program assists in providing inmates on the autism spectrum with coping mechanisms and tools to be able to manage better once released from the program and assigned to general population.

The *Axis II Program* is for inmates with borderline personality disorder or other severe personality disorders who have a history of behavioral problems in the prison, but who are amenable to treatment.³³ More recently, this program has been called *STAGES (Steps Toward Awareness, Growth, and Emotional Strength)*. The program is designed to increase time between disruptive behaviors, foster living within the general population or community setting, and increase pro-social skills. The Stages Program is available at FMC Rochester, USP Florence, and FCI Terre Haute.³⁴

Mental Health Step-Down Units provide intensive treatment for inmates recently released from in-patient psychiatric hospitalization. Sometimes, inmates are placed in these units in an effort to avoid the need for in-patient hospitalization.³⁵

Acceptance into any of the Mental Health Treatment Programs requires a diagnosis of mental illness or behavior disorder and a demonstrated need for intensive treatment (demonstrated by prior psychiatric hospitalizations/interventions, complex treatment with psychotropic medication, major functional impairment, or repeated incidents of severe behavioral problems in prison). Inmates in a residential treatment program reside together on a unit, with their living areas being separate from the general population, allowing the inmates to create a therapeutic community environment. Most of their other activities, recreation, work assignment, and meals are shared with the general population inmates assigned to that particular facility. This placement also helps to protect mentally ill inmates from injuring themselves, from being victimized, and from being negatively influenced by peers in the general population. Inmates in these residential programs are still subject to being victimized; however, the potential for victimization is reduced. Unfortunately, the

BOP has very limited capacity and lengthy waiting lists for placing inmates in one of these programs. With such limited capacity, the need for thorough documentation of prior mental health history in the PSR is readily imperative. Without documented need for special placement, an inmate will be placed in the general population, with greatly increased chances of restrictive housing, isolation, and other counter-productive sanctions rather than treatment.

2. The Resolve Program

The Resolve Program is a cognitive-behavioral program designed to address trauma-related mental health needs of inmates. Specifically, the program works with those who have previously been victims of child abuse or neglect, sexual assault, domestic violence, or other trauma known to correlate with psychological disorders. Starting with an eight-hour workshop, the program is followed by six months of nonresidential treatment and seeks to decrease the incidence of trauma-related pathology and improve inmates' level of functioning.³⁶ Since 2007, the Resolve Program has been implemented at all BOP facilities housing women (except during times that the institution lacks a psychologist to lead the program).³⁷ The program is available for men at the maximum security prison in Florence, Colo., and at FCI Danbury (Low) in Connecticut.³⁸

3. The Challenge Program

The Challenge Program is a residential cognitive-behavioral treatment program developed for male inmates in penitentiary settings. The Challenge Program, which lasts at least nine months, provides three phases of treatment to high-security inmates with substance abuse problems and/or mental illness. Like the Mental Health Treatment Programs, participants live together on a unit separate from the general population. Incentives and rewards are available for successful completion of phases and of the program.³⁹ The program is available at several BOP facilities, but not at all of them.

Substance Abuse Programs

The BOP offers several different options for those inmates dealing with substance abuse issues, ranging from education to intensive treatment.⁴⁰

1. Drug Abuse Education

Drug abuse education includes a series of classes providing education about substance abuse and its unwanted side effects. The classes may help identify offenders who need more than education.⁴¹ Any inmate is eligible to participate in drug abuse education classes, as long as he or she is not already enrolled in or has not already completed the residential drug abuse treatment program and has enough time remaining in custody to complete the course. The course is available at all BOP institutions.

2. Nonresidential Drug Abuse Treatment

Nonresidential drug abuse treatment is a 12-week cognitive-behavioral therapy treatment program, usually conducted in group-therapy sessions. The program addresses the link between substance abuse and criminal lifestyles and provides opportunities for building and improving skills in rational thinking, communication, and community adjustment. The program is intended for inmates with relatively short sentences, those transitioning to the community, those who have failed a urinalysis drug screen, and for addicts in need of substantial

treatment who are on the waiting list for the RDAP intensive treatment program or who are not eligible for RDAP.⁴² All BOP institutions have this program, which is open to any inmate who volunteers.⁴³

3. Residential Drug Abuse Program (RDAP)

RDAP is an intensive residential treatment program, followed by transitional treatment in the community following release. Inmates in the program live in a prison housing unit separate from the general population in a modified therapeutic community setting. They spend half of each weekday in treatment, including individual and group counseling, and the other half of each day is spent in school, work, or vocational training.⁴⁴ This portion of RDAP must last at least six months.⁴⁵ The usual length of time of the residential portion of the treatment is approximately 10 months.

To be eligible for RDAP, the inmate must have a verifiable substance use disorder that was active within one year of the offense for which he or she is incarcerated.⁴⁶ This means for eligibility, the offender must have been actively using substances within one year from the date of the arrest. For this reason, it is critical for the PSR to document active substance abuse and any prior efforts at treatment. Details of where and when treatment in the community was obtained should also be documented in the PSR for easy reference. A defendant who denies having a substance abuse problem during his or her presentence interview will have a much harder time establishing eligibility for the program later. An inmate must also sign an agreement to comply with program responsibilities and requirements; finally, an inmate must have sufficient remaining time on his or her sentence to complete the full program or admission to the program will be denied.⁴⁷

The RDAP program is widely sought because studies have demonstrated its effectiveness in preventing relapse to drug use and in reducing criminal recidivism.⁴⁸ The program is also popular because eligible inmates who successfully complete the program can reduce the length of their prison sentences by 10 percent, up to a maximum of one year.⁴⁹ Because of the program's popularity, there is a waiting list to get into RDAP, and not all who need the program can get it.

There are also eligibility requirements for early release, such that not every participant in the program will receive the benefit of early release under 18 U.S.C. § 3621 (e). Those ineligible for early release include illegal aliens; pretrial detainees; military inmates or state inmates serving time in a BOP facility; inmates who previously completed the program and got an early release the first time; inmates currently serving a sentence for any violent felony, sex offense involving a minor, or any attempt, solicitation, or conspiracy to commit such violent felony or sex offense; and inmates with a detainer and inmates with a previous conviction (within 10 years of the sentence on current offense) for homicide, rape, robbery, aggravated assault, arson, kidnapping, or sexual abuse of a minor.⁵⁰

Sex Offender Programs

The BOP offers sex offender treatment programs for inmates serving criminal sentences and for those who have been civilly committed as predatory sex offenders suffering from mental illness that renders them dangerous to the community.

1. Nonresidential Sex Offender Treatment Program

The nonresidential sex offender treatment program consists of

outpatient groups meeting two to three times per week for a total of six to eight hours per week. Completion of this moderate intensity program takes at least nine months. Participants learn basic skills and concepts to help them understand their past offenses and to reduce risk of future offending. Eligibility for this program is limited to offenders who have been evaluated and found to have low to moderate risk of re-offending. Attorneys should advise clients that the BOP uses this program to identify persons likely to re-offend, and therefore, participation carries risks. However, failure to participate, if recommended by the BOP, can result in loss of good-time credit. The nonresidential sex offender treatment program is available at FCI Elkton, FCI Englewood, FCI Marianna, FCI Petersburg, FCI Seagoville, USP Marion, and USP Tucson for male offenders and at FMC Carswell for female offenders.⁵¹

2. Residential Sex Offender Treatment Program

The residential sex offender treatment program involves high-intensity programming for a period of 12 to 18 months. The BOP provides this program at FMC Devens in Massachusetts. Participants benefit from a therapeutic community on a residential housing unit where they work to reduce their risk of future offending. Offenders receive treatment five days per week. The program is targeted to offenders with an elevated risk of re-offending.⁵²

3. New Butner Program

Butner recently added a new program—the Commitment and Treatment Program (CTP) for Sexually Dangerous Persons—in lieu of the residential sex offender treatment program. Little information is available about this program due to its recency.

4. Involuntary Civil Commitment

Inmates who have served their sentences but are deemed at high risk of re-offending because of severe mental illness can be involuntarily committed to the custody of the attorney general for continued confinement and treatment.⁵³ Some defense attorneys may advise their clients not to participate in sex offender treatment programs because information disclosed in treatment has sometimes been the basis for seeking an order of civil commitment.⁵⁴

Policies and Programs for Pregnant Inmates

Female inmates are medically screened for pregnancy upon admission to the BOP, and they are instructed to inform medical staff immediately if they suspect they are pregnant.⁵⁵ The BOP provides female inmates with medical and social services related to pregnancy, birth control, and child placement, as well as access to abortion. If necessary, childbirth takes place at a hospital outside the institution.⁵⁶ Previously, an inmate could be handcuffed during delivery, but a provision of the First Step Act now prohibits such use of restraints except in limited circumstances.⁵⁷ Outside social service agencies are contacted to help the inmate find an appropriate placement for the baby. Newborns are not allowed to return to the prison with their mothers, but they can accompany an adult visitor to the prison for visitation, in accord with the prison's visitation policies.

Attorneys representing a client who is pregnant or has a young child need to be aware of two special situations in the BOP, discussed below.

Abortion

Federal law popularly known as the “Hyde Amendment” prohibits

use of federal funds to perform or facilitate abortions except where the mother's life is endangered or in cases of rape or incest.⁵⁸ This law applies to and is followed by the BOP.⁵⁹ Pursuant to 28 C.F.R. § 551.23, a pregnant inmate receives medical, religious, and social counseling about her pregnancy decision. If she decides to have an abortion, arrangements are made for these medical services to be provided at an appropriate clinic outside the institution, at the inmate's expense (or her family's). Even though not paying for the abortion procedure, the BOP may pay to escort the inmate to the procedure. Under BOP policy, BOP employees may decline to participate in the provision of abortion counseling or services, including transportation.⁶⁰

The MINT Program

MINT (Mothers and Infants Nurturing Together) is an alternative residential program for low-risk female inmates who are pregnant when they arrive in prison. Eligible female inmates can enter the program two months before their delivery due date, and they can remain in the program for three months after the baby is born.⁶¹ The program's purpose is to promote parent-child bonding and to improve parenting skills for the new mother. The program is administered through the Community Corrections Centers (CCC) and Residential Re-entry Centers (RRC), and the inmate must qualify to participate. A woman with more than five years to serve, who gets pregnant while incarcerated, or who plans to place the child for adoption is not eligible for the program, nor are sex offenders; deportable non-citizens, those with pending charges or a history of violence, or those requiring psychiatric hospitalization.⁶² Another requirement is that the mother be able to provide financial support for herself and her child (so that the BOP does not have to pay), but she may seek help from Social Services.⁶³ Prior to the child's birth, the mother must make custodial arrangements for the child, because after the three-month bonding period, she must return to her original prison to finish her sentence.⁶⁴ The CCC or RRC provides psychological counseling, drug counseling, and parenting classes.

One facility differs from the other federal MINT programs: Greenbrier Birthing Center, overseen by the Baltimore Residential Reentry Office, operates under a contract with the BOP. A female may remain at Greenbrier up to 12 months with her child after birth. Located in Hillsboro, W. Va., the program seeks to provide a "home-like environment" to promote bonding and parenting skills. The facility has 20 private bedrooms, with every two rooms sharing a bathroom. The common area has a kitchen, recreation room, education room, physical training area, laundry facilities, and a phone room. Greenbrier also offers more programming than the minimum required by the BOP; in addition to parenting classes, psychological counseling, and substance abuse counseling and weekly screening, Greenbrier provides life skills classes, financial management, job readiness, and GED classes and testing onsite, all of which are intended to motivate and help the mother provide a stable environment for the child upon her release from custody.⁶⁵

BRAVE Program

The BRAVE Program (Bureau Rehabilitation and Values Enhancement) is for young male offenders serving their first federal sentence. To qualify for the program, an inmate must be 32 years of age or younger, with a sentence of five years or longer, and federally incarcerated for the first time. The program utilizes a cognitive-behavioral

approach to promote favorable institutional adjustment, positive interaction with staff members, and self-improvement activities. During the six-month residential program, inmates live together in a unit, completing an Orientation Phase, Core Treatment Phase, and Transition Phase.⁶⁶ The BRAVE Program is offered at FCI Beckley and FCI Victorville-medium.

Educational Programs

An adult literacy program leading to the completion of a GED is available in each BOP institution. Inmates without a verified high school diploma or GED certificate who have the capacity to obtain one are expected to work towards completion of this program while incarcerated.⁶⁷ The Warden at each facility is also to ensure the availability of an English as a Second Language program for non-English-speaking inmates who score below eighth grade proficiency in reading and listening comprehension in English.⁶⁸

The BOP Program Statement on Education notes the goal of providing postsecondary educational opportunities and adult continuing education classes for inmates.⁶⁹ Individual classes in typing, computer literacy, and parenting skills are available as continuing education courses, but the reality is that reduced funding and prisoner ineligibility for Pell grants has limited the availability of postsecondary education for many inmates. Some BOP facilities have access to community college programs in which professors come to the facility to teach classes, and some have correspondence school options available to inmates. The attorney for a defendant who hopes to obtain some collegiate education should check the handbook for facilities where the client is likely to be placed to determine what advanced programs, if any, are available at the institutions.

Vocational Programs

The BOP endeavors to provide vocational education opportunities for inmates with limited employment history and few marketable skills. Vocational training is available in the form of apprenticeship programs, certificate programs, and on-the-job training in various fields.⁷⁰ Popular apprenticeship programs include HVAC, electrical, and welding. The same programs are not available at every facility, however, and an attorney should determine which facilities offer a program that the client wishes to learn.

Conclusion

A defendant's legal team must determine what medical and nonmedical information needs to be included (or not included) in the client's presentence report. The goal is to request the client's placement in a facility appropriate to his or her security classification, but also taking into consideration the individual medical, psychological, and educational/programming needs of the defendant. Accuracy and documentation of information from the beginning of representation is key to accomplishing this goal. Further, it is advisable for the legal team to call the classification center in Grand Prairie or to speak with staff at specific facilities to verify that desired programs are still available at that facility. Individual facilities sometimes "supplement" BOP practices based on local needs and resources, without public notification. Particularly if the defendant may be placed in a private contract facility, the attorney needs to learn about the programs, medical resources, and mental health care available at that facility and the requirements for eligibility. Most low-security non-U.S. citizen inmates are placed in one of the BOP's contract for-profit

prisons. Only by knowing the client's needs and obtaining the appropriate documentation for the presentence report can the attorney give a defendant the best shot at receiving appropriate treatment and programming while incarcerated. ☉

Dr. Marc Blatstein (info@pprsus.com) had a successful podiatric medical practice for 30 years providing quality patient care. In 2006, he was convicted of felony mail fraud and served one year and one day in prison for the actions of his office billing department's use of incorrect billing codes. He maintains an active medical license and is the founder of Physician Presentence Report Service, LLC. Fay F. Spence is an attorney with more than 30 years of experience in criminal law. She currently serves as a pro se law clerk for

the U.S. District Court for the Western District of Virginia. E.J. "Jay" Hurst II (jayhurst@jayhurst.net) has worked with BOP inmates and federal defendants since 2001. Besides criminal defense and post-conviction law, Hurst pursues federal government records under the Freedom of Information Act and will periodically go to court on civil rights matters. Maureen Baird (moiep@aol.com) served as warden at the Federal Correctional Institution in Danbury, Conn., and at the Metropolitan Correctional Center in New York City. While there, she was appointed to senior executive staff by the U.S. Attorney General. She then became warden of the U.S. Penitentiary in Marion, Ill.
